

A GUIDE TO YOUR LOFT INSULATION

LOFT INSULATION

What has been installed?

Isover loft insulation has been installed in your property to a thickness of 270mm.

Loft Insulation is a barrier of material in your roof space that traps heat, making your home more energy efficient and helps to reduce energy bills.

The insulation is laid in two layers between and across the joists (the horizontal beams along the floor of your attic) in order to create a complete insulation layer.

Loft insulation stops heat from escaping from the living areas of your home and helps to keep your home warmer in the winter and cooler in the summer.

SAFETY INFORMATION

- Going into your loft is not advised due to the insulation covering the joists.
- Keep insulation materials away from children and pets.
